(54) Title: LOCATOR AND CLOSURE DEVICE AND METHOD OF USE

(57) Abstract: The present invention is directed to a device which is capable of both locating a punctured blood vessel wall and sealing the puncture in the vessel and to the method of using the device as well. In one embodiment, the device includes an elongate deployment member having a sealing element releasably disposed within a distal end thereof, said deployment member being coupled to a first actuator configured to retract said deployment member relative to said sealing element, and an elongated indicator member having a proximal end and a distal end, said indicator member extending through a lumen in said deployment member such that the distal end of said indicator member extends distally of the distal end of the deployment member, and said indicator member being coupled to a second actuator configured to retract said indicator member relative to said deployment member.

WO 2006/118877 A2

## LOCATOR AND CLOSURE DEVICE AND METHOD OF USE

### FIELD OF THE INVENTION

- The present invention relates generally to apparatus and methods for sealing or closing  
passages through tissue, and more particularly to devices for sealing punctures or other  
5 openings communicating with body lumens, such as blood vessels, and to apparatus and  
methods for delivering such devices.

### BACKGROUND OF THE INVENTION

Catheterization and interventional procedures, such as angioplasty and stenting,  
generally are performed by inserting a hollow needle through a patient's skin and muscle tissue  
10 into the vascular system. This creates a puncture wound in a blood vessel, frequently the  
femoral artery, which, once the interventional procedure has been completed, needs to be  
closed or sealed in a suitable manner.

Procedures and devices have been proposed for accomplishing such closure which  
involve the use of an introducer sheath that is placed in the tract of the puncture wound  
15 following which a closure delivering device is introduced through the introducer sheath to  
deploy a sealing element within the tract. An indicator wire may be used to locate the edge of  
the tract. After the closure delivering device deploys the sealing element, the indicator wire  
and the device are retracted. Examples of such procedures and devices are disclosed in  
Application Serial No. 10/687,848, filed October 17, 2003 and Serial No. 10/850,795 filed May  
20 21, 2004. In these procedures and devices, it would be desirable to have a mechanism that  
prevents a user from prematurely retracting the closure delivering device when deploying the  
sealing element. Further, it would be desirable to have a mechanism that prevents the indicator  
wire from interfering with the deployment of the sealing element.

### SUMMARY OF THE INVENTION

25 The present invention is directed to a device which is capable of both locating a  
punctured blood vessel wall and sealing the puncture in the vessel and to the method of using  
the device as well.

In one embodiment, the device includes an elongate deployment member having a  
sealing element releasably disposed within a distal end thereof, said deployment member being  
30 coupled to a first actuator configured to retract said deployment member relative to said sealing  
element, and an elongated indicator member having a proximal end and a distal end, said

indicator member extending through a lumen in said deployment member such that the distal end of said indicator member extends distally of the distal end of the deployment member, and said indicator member being coupled to a second actuator configured to retract said indicator member relative to said deployment member.

5 In another embodiment, the device includes an indicator that notifies the operator when the distal end of the indicator member is positioned at a desirable location within the puncture.

Other systems, methods, features and advantages of the invention will be or will become apparent to one with skill in the art upon examination of the following figures and detailed description. It is intended that all such additional systems, methods, features and 10 advantages be included within this description, be within the scope of the invention, and be protected by the accompanying claims.

#### DESCRIPTION OF THE DRAWINGS

In order to better appreciate how the above-recited and other advantages and objects of the present inventions are obtained, a more particular description of the invention briefly 15 described above will be rendered by reference to specific embodiments thereof, which are illustrated in the accompanying drawings. It should be noted that the components in the figures are not necessarily to scale, emphasis instead being placed upon illustrating the principles of the invention. Moreover, in the figures, like reference numerals designate corresponding parts throughout the different views. However, like parts do not always have like reference 20 numerals. Moreover, all illustrations are intended to convey concepts, where relative sizes, shapes and other detailed attributes may be illustrated schematically rather than literally or precisely.

Fig. 1 illustrates a side-view of a sealing element deployment device in accordance with a preferred embodiment of the present invention.

25 Fig. 2A illustrates a side-view of a sealing element deployment device in accordance with a preferred embodiment of the present invention.

Fig. 2B illustrates a side-view of a sealing element deployment device in accordance with a preferred embodiment of the present invention.

30 Fig. 2C illustrates a side-view of a distal portion of the sealing element deployment device in accordance with a preferred embodiment of the present invention.

Fig. 2D illustrates a side-view of a distal portion of the sealing element deployment device in accordance with a preferred embodiment of the present invention.

Fig. 3 illustrates a perspective view of components of a sealing element deployment device in accordance with a preferred embodiment of the present invention.

5 Figs. 4(a-b) illustrate a distal portion of the device in accordance with a preferred embodiment of the present invention.

Figs. 5(a-b) illustrate a top view of a window portion of the sealing element deployment device in accordance with a preferred embodiment of the present invention.

10 Fig. 6 illustrates a perspective view of a window portion of the sealing element deployment device in accordance with a preferred embodiment of the present invention.

#### DETAILED DESCRIPTION OF THE INVENTION

A device 100 for deploying a detachable sealing element 160 (shown in Fig. 2) in a puncture wound is shown in Fig. 1, herein referred to as a closure device 100. Examples of such a sealing element or plug 160 are described in U.S. Application Serial No. 10/687,848, filed October 17, 2003, Serial No. 10/850,795 filed May 21, 2004, and Serial No. 11/038,995, filed January 19, 2005, each of which applications are hereby incorporated by reference.

Sealing element 160 occludes blood flow from a puncture. In a preferred embodiment, the sealing element 160 will be fabricated from a material which expands upon contact with blood such as a felt made from polyglycolic acid and/or polylactic acid polymers or copolymers or other materials such as collagens. The sealing element 160 may also have one or more hemostasis, antibiotic or other therapeutic agents added to it.

Alternatively, in other preferred embodiments, the sealing element 160 will be made in such a manner that it will expand spontaneously or upon removal of a restraining force. In still other embodiments, the sealing element 160 can be expandable mechanically, hydraulically or pneumatically. In all such embodiments, it is preferred that the sealing element 160 be fabricated from a bioabsorbable material.

The closure device 100 for deploying the sealing element 160 includes a tubular elongate member 1, herein referred to as the "housing," which houses various components that will be described below. The device 100 also comprises a wire actuator 2 which is external and distal to the housing 1 and is slidably mounted and configured to actuate an indicator wire 6, as described below. Extending through the distal end of the housing 1 is a deployment tube 7

configured to be received by an introducer sheath 300 known in the art. The deployment tube 7 is slightly longer than the introducer sheath 300. The deployment tube 7 receives an indicator wire 6 (shown in Figs. 2a and 2b) and a pusher 80, which operates as a backing member supporting a detachable sealing element 160 at a distal section of the deployment tube 7. The

5 pusher 80 preferably includes a channel through which the indicator wire 6 may be received within the tube 7. The channel is preferably located on or near the edge or the periphery of the backing portion of the pusher 80, i.e., near the internal surface of the deployment tube 7.

Optionally, an indicator wire tube or other lumen (not shown) may be provided within the interior of the deployment tube 7. The indicator wire tube is preferably attached to the housing

10 1 at its proximal end, and extends through the deployment tube 7. The indicator wire 6 then extends through the indicator wire tube or other lumen and exits the indicator wire tube at or near the distal end of the deployment tube 7. (Additional details of the structure and operation of the pusher 80 are described in Serial No. 10/850,795, filed May 21, 2004, which is incorporated by reference)

15 The deployment tube 7 includes an inlet port 22 in the distal section of the tube 7, configured to take in blood when exposed to a vessel, and the housing 1 includes an outlet port 23 communicatively coupled to the inlet port 22 for allowing the blood to exit outside of the puncture wound. Also extending out of the housing is a trigger 8 that preferably includes a rotary link 14 configured to deploy the detachable sealing element 160. Before operation of the closure device 100, the rotary link 14 is locked, i.e., the operator is prevented from actuating 20 the rotary link 14 despite pressing the trigger 8, as described below.

Turning to Figs. 2(A-D), deployment of a detachable sealing element 160 within a puncture wound 400 using the closure device 100 is illustrated. An introducer sheath 300 is already deployed within the tract 410 of the wound 400 with its distal end 310 exposed within 25 the lumen 420 of a blood vessel defined by a vessel wall 430. The deployment tube 7 of the closure device 100 is inserted into the introducer sheath 300. Upon substantially complete insertion, the device 100 is engaged with the introducer sheath 300, and the distal section of the deployment tube 7 extends out of the distal end of the sheath 300. When the inlet port 22 is exposed to the lumen 420 of the vessel 430, blood will enter the inlet port 22 and travel out of 30 the outlet port 23 extending out of the housing 1. The blood exiting the outlet port 23 will be visible to the operator (not shown) of the device 100, notifying the operator that the distal end

of the deployment tube 7 is within the lumen 420 of the vessel 430 and outside of the tract 410 of the puncture wound 400.

Also upon substantially complete insertion, the wire actuator 2 of the device 100 is actuated by the proximal end of the sheath 300, causing the wire actuator 2 to be pushed toward the housing 1. The wire actuator 2 is mechanically coupled to the indicator wire 6 and configured to actuate the indicator wire 6 in the distal direction. Thus, as the wire actuator 2 is pushed towards the housing 1, the wire actuator 2 causes the indicator wire 6 to extend out of the distal end of the deployment tube 7. When the indicator wire 6 exits the tube 7, the distal section of the wire 6 forms into a loop 5 located adjacent the distal tip of the tube 7. The loop 5 of the wire 6 will come into contact with the vessel wall 430 near the edge 415 of the tract 410 when the device 100 and the sheath 300 are withdrawn, as shown in Fig. 2b.

Turning to Fig. 2b, after the device 100 is inserted and engaged into the sheath 300 as described above, the operator withdraws or pulls back the device 100 and sheath 300 within the tract 410. When the distal section of the deployment tube 7 exits the lumen 420 and enters the tract 410, the inlet port 22 is no longer exposed to the blood within the lumen 420 and thus, the blood flow out of the outlet port 23 ceases. This notifies the operator that the distal section of the deployment tube 7 has exited the lumen 420 and entered the tract 410 of the puncture wound 400. The indicator wire's 6 resistance that is caused by the loop 5 engaging the vessel wall 430 will unlock the rotary link 14, as described below, and optionally toggle the indicator window 13 to a state that indicates that the loop 5 has engaged the vessel wall 430 near the edge 415 of the tract 410, which places the distal end of the deployment tube 7 at a desirable location within the tract 410 and substantially adjacent to the edge 415. In the embodiment shown in Fig. 2b, the indicator window 13 toggles from a striped pattern, Fig. 2a, to a solid pattern, as described below.

The operator is then enabled to actuate the unlocked rotary link 14 to deploy the sealing element 160 by pressing the trigger 8. Turning to Figs. 2C and 2D, the rotary link 14 actuates and withdraws both the wire 6 and the tube 7 while the sealing element 160 remains substantially in place by the pusher 80, thereby deploying the sealing element 160. The device 100 then disengages from the sealing element 160, thus sealing or plugging the puncture wound 400. Preferably, in one motion, the rotary link 14 is configured to withdraw the indicator wire 6 into the tube 7 before the tube 7 is withdrawn. Thus, the wire 6 is withdrawn before the

sealing element 160 deployed, preventing the wire 6 from interfering with the deployment of the sealing element 160, such as damaging or dislodging the sealing element 160.

Turning to Fig. 3, a rack and pinion system for actuating the tube 7 and the wire 6 within the housing 1 of the device 100 is shown. The device 100 is shown not engaged to a introducer sheath 300, and thus the wire actuator 2 is in its original state away from the housing 1. The wire actuator 2 is coupled to a first rack 4 that is configured to engage a first gear 3 when the wire actuator 2 is actuated in the proximal direction as described above. The first gear 3 is attached to a second gear 16, which causes a second rack 50 to move in the distal direction. The second rack 50 is engaged with the indicator wire 6, causing the indicator wire 6 to extend out of the tube 7 when wire actuator 2 is actuated by engaging with the introducer sheath 300 as described above. The wire actuator 2 proximally withdraws the first rack 4, which rotates the second gear 16 via the first gear 3, which then advances distally the second rack 50, thus advancing distally the indicator wire 6, causing the indicator wire to extend out of the deployment tube 7.

The first and second gears 3 and 16 share an axis that is secured by a bottom plate 101. The bottom plate 101 is actuated by a trigger that includes a rotary link 14. When the trigger 8 is pressed to deploy the plug 160, the rotary link 14, which includes an arcuate gear section 15 that engages and actuates the bottom plate 101 in the proximal direction, is actuated. A tube collar 115, which is engaged to the deployment tube 7, is anchored at a distal portion of the bottom plate 101. When the bottom plate 101 is withdrawn proximally, the collar tube 115 is withdrawn as well, which in turn withdraws proximally the deployment tube 7, which deploys the plug 160. Proximally withdrawing the bottom plate 101 causes the first gear 3 to rotate along the first rack 4, which is locked in place by the wire actuator 2 engaged with the introducer sheath 300. Proximal to the wire actuator 2 is a post 116 that extends from the housing 1. When the distal portion of the closure device 100 is inserted into the lumen of the introducer sheath 300, a proximal portion of the introducer sheath 300 that defines a lip (not shown) engages the post 116, which connects and locks the closure device 100 to the introducer sheath 300. Thus, the second rack 50 is proximally withdrawn by the second gear 16, which causes the indicator wire 6 to retract substantially simultaneously with the deployment tube 7. The figures show that the first gear 3 has a smaller diameter than the second gear 16. First and second gears 3 and 16 each provide a mechanical advantage to the control of the indicator wire 6 and deployment tube 7 respectively. Preferably, the mechanical

advantage regarding the indicator wire 6 is 4:1 and the mechanical advantage regarding the deployment tube 7 is 2:1. Other mechanical advantage relationships may be used e.g., 3:1 for the indicator wire 6 and 1.5:1 for the tube 7. It is preferred that the mechanical advantage for the indicator wire 6 be twice that for the tube 7. Thus, when trigger 8 is depressed, the bottom 5 plate 101 and tube collar 115 will withdraw the tube 7 more slowly than the indicator wire 6 is withdrawn into the device 100 and the indicator wire 6 will be retracted into the deployment tube 7 before the sealing element 160 is deployed and/or disengaged from the tube 7 and the device 100. As described above, this advantageously prevents the indicator wire 6 from interfering with the deployment of the sealing element 160.

10 One of ordinary skill in the art will appreciate that though a rack and pinion system is described and shown in Fig. 3, any suitable type of actuating system may be configured to retract the indicator wire 6 before a sealing element 160 is deployed and/or disengaged from the device 100 in accordance with a preferred embodiment of the present invention. For example, a hydraulic, electronic, and/or a pulley system may be used instead of or in addition to the rack 15 and pinion system to retract the indicator wire 6 into the deployment tube 7 before the sealing element 160 is deployed and/or disengaged from the device 100.

The housing 1 can also include an indicator assembly 200 coupled to a stationary top plate 150 of the device 100. The indicator assembly 200 can indicate to the operator, via an indicator panel 13 in the top plate 150, whether the distal end of the deployment tube 7 is in the desired location, e.g., near the edge 415 of the tract 410 of the puncture wound. In addition to, 20 or in the alternative, the indicator assembly 200 may further lock the trigger 8 until the deployment tube 7 is in the desired location. In Figs. 4A and 4B, an implementation of the indicator assembly 200 of the device 100 is shown. The indicator assembly 200 comprises an indicator 20, indicator spring 19 and lockout plate 17. As can be seen from Fig. 4A, a slidable 25 lockout plate 17 engages groove 18 in rotary link 14, thereby preventing substantial movement of rotary link 14. The indicator spring 19 applies a proximal force on the lockout plate 17 to maintain the lockout plate's 17 position even after the indicator wire 6 is deployed from the tube 7.

Turning to Fig. 4B, the indicator wire 6 is fixedly attached to the lockout plate 17, 30 which is coupled to a block 9 via the indicator spring 19. The block 9 is in a secured position, fixed to the housing 1 and/or the tube 7. Because the indicator wire 6 is connected to the tube 7

and/or housing 1 via a spring 19 and slidable lockout plate 17, the indicator wire 6 is capable of axial movement independent of the housing 1 and/or tube 7.

During operation, after the indicator wire 6 has been deployed through the puncture wound 400 with the formed loop 5 exposed to the lumen 420 of a vessel defined by a vessel wall 430, the operator is then ready to withdraw the device 100 and sheath 300 to deploy the sealing element 160 within the tract 410 of the puncture wound 400. Even if blood stops flowing out of the outlet port 23, that only indicates that the inlet port 22 is within the tract 410, not necessarily that the sealing element 160 is desirably near the edge 415 of the tract 410,

However, the indicator wire 6 may provide such an indication. When the loop 5 of the wire 6 approaches the edge 415 of the tract 410, the loop 5 will engage the vessel wall 430 near the edge 415 as the device 100 is withdrawn by the operator. When the loop 5 engages the vessel wall 430, it will cause a force to be applied on the wire 6 toward the distal direction, or direction opposite that of the device 100 as its being withdrawn. This force will overcome the force of the spring 19 securing the lockout plate 17, proximally withdraw the lockout plate 17 in the distal direction, and cause the lockout plate 17 to disengage from the groove 18 of the rotary link 14, thereby unlocking the trigger 8. When the trigger 8 is unlocked, because the loop 5 has caught the edge 415, the distal end of the tube 7 is substantially adjacent to the edge 415 of the tract 410, which is a desirable location for the deployment of the sealing element 160. The operator is then enabled to deploy the sealing element 160.

Even though a spring loaded system is described above for locking and unlocking the trigger 8, one of ordinary skill in the art would appreciate that any locking mechanism may be employed in accordance with an embodiment of the present invention, such as a hydraulic and/or electronic system.

In addition to locking and unlocking the trigger 8, the indicator assembly 200 may also provide a visual and/or audio notification to the operator that the distal end of the tube 7 is in a desirable position. As will be explained in more detail with regard to Figs. 4A, 4B, 5A, 5B, and 6, indicator 20 can be seen through indicator panel 13, which defines two windows 21, on the top plate 150 and indicates to the user when the appropriate time to depress trigger 8 with rotary link 14 has been reached.

Figs. 5A and 5B show a top view looking down through the windows 21, indicator 20 is provided with opaque portions 22. The windows 21 preferably have a shape consistent with the shape of markings 22 on the indicator 20. Thus, prior to the indicator wire 6 being axially

displaced opposite of the housing 1 and/or tube 7, some or all of the windows 21 are clear, but when the indicator wire 6 is axially displaced opposite of the housing 1 and/or tube 7 as described above, markings 22 on the indicator 20 come into correspondence with the windows 21 of the indicator panel 13 as shown in Fig. 5B. When this registration occurs, trigger 8 may 5 be depressed.

Fig. 6 essentially shows the same thing as Figs. 5A and 5B, but from a perspective view.

One of ordinary skill in the art would appreciate that though windows 21 are described, the indicator panel 21 may also utilize other mechanisms, such as electronic circuitry, light 10 emitted diodes (LED), and/or other visual and/or audio mechanisms known in the art. For example, the device 100 may be configured such that when the indicator wire 6 engages the vessel wall 430 near the edge 415 of the tract 410, a circuit (not shown) is triggered within the housing 1 that causes a light to be emitted and/or an audio alarm to be invoked.

In the foregoing specification, the invention has been described with reference to specific embodiments thereof. It will, however, be evident that various modifications and changes may be made thereto without departing from the broader spirit and scope of the invention. For example, the reader is to understand that the specific ordering and combination of process actions described herein is merely illustrative, and the invention can be performed using different or additional process actions, or a different combination or ordering of process 15 actions. As a further example, each feature of one embodiment can be mixed and matched with other features shown in other embodiments. Additionally and obviously, features may be added or subtracted as desired. Accordingly, the invention is not to be restricted except in light 20 of the attached claims and their equivalents.

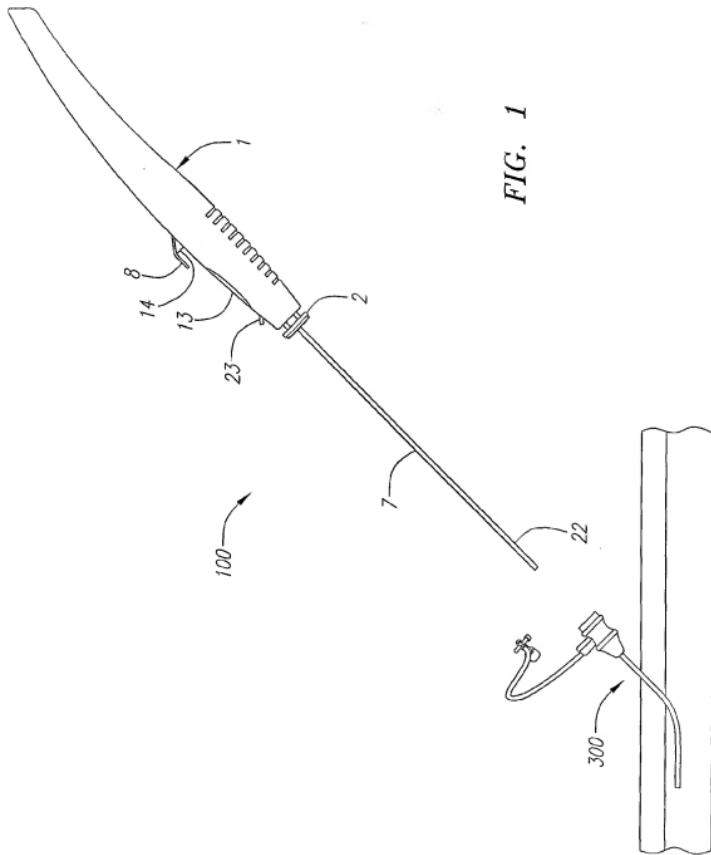

**WHAT IS CLAIMED:**

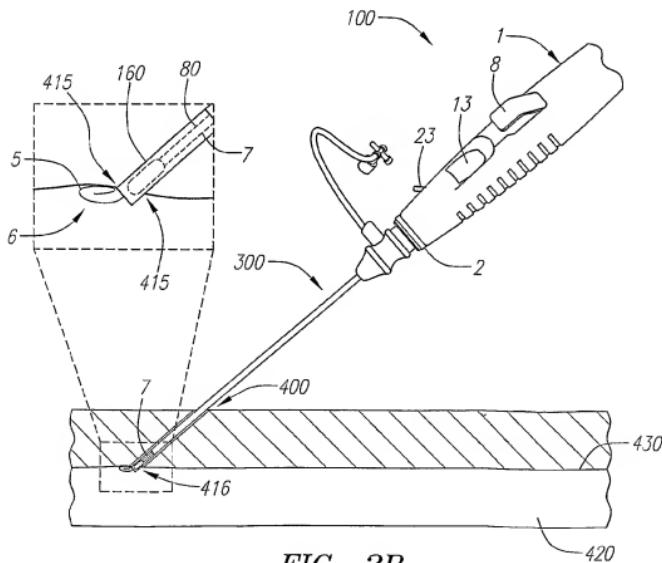

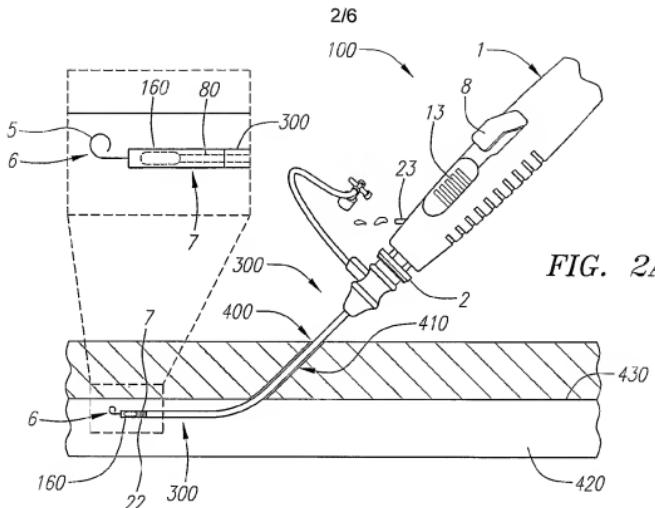

1. A device for sealing a puncture in the wall of the body lumen comprising:
  - an elongate deployment member having a sealing element releasably disposed within a distal end thereof, said deployment member being coupled to a first actuator configured to retract said deployment member relative to said sealing element, and
  - an elongated indicator member having a proximal end and a distal end, said indicator member extending through a lumen in said deployment member such that the distal end of said indicator member extends distally of the distal end of the deployment member, and said indicator member being coupled to a second actuator configured to retract said indicator member relative to said deployment member.
2. The device of claim 1, further comprising a housing encasing the first and second actuators.
3. The device of claim 2, further comprising a trigger, coupled to the housing and configured to actuate the first and second actuators in one movement.
4. The device of claim 1, wherein the first and second actuators are first and second gears, further wherein the first and second gears form first and second rack and pinion mechanisms respectively.
5. The device of claim 4, wherein the diameter of the first gear is substantially smaller than the diameter of the second gear.
6. The device of claim 4, wherein the rack and pinion mechanisms each have a mechanical advantage and the ratio of mechanical advantages for the first rack and pinion mechanism to the second rack and pinion mechanism is 2 to 1.
7. The device of claim 4, wherein the rack and pinion mechanisms each have a mechanical advantage and the ratio of mechanical advantages for the first rack and pinion mechanism to the second rack and pinion mechanism is 3 to 1.
8. The device of claim 1, wherein the first and second actuators are hydraulic devices.
9. The device of claim 2, wherein the housing further includes an indicator configured to notify an operator when the distal end of the indicator member is positioned at a desirable location within the puncture.
10. The device of claim 9, wherein the indicator includes an LED that emits a light when the distal end of the indicator member is positioned at a desirable location within the puncture.

11. The device of claim 9, wherein the indicator includes a window and the proximal end of the indicator member is coupled to an indicator marker located below the window, wherein the indicator marker moves to a predetermined position within the window when the distal end of the indicator member is positioned at a desirable location within the puncture.
12. The device of claim 2, wherein the housing includes an audio alarm operatively coupled to the indicator member that emits a sound when the distal end of the indicator member is positioned at a desirable location within the puncture.
13. The device of claim 12, wherein the desirable location is adjacent to an edge of the puncture.
14. The device of claim 1, wherein said device comprises a bleed back conduit defined in the deployment member.
15. The device of claim 1, wherein the first and second actuators are configured to withdraw the deployment member and indicator member respectively at different rates, wherein the rate of withdrawal for the indicator member is greater than the rate of withdrawal for the deployment member.
16. The device of claim 3, further comprising:
  - a lock out plate coupled to the trigger and configured to prevent the trigger from substantial movement; and
  - an indicator spring coupled to the lock out plate and configured to disengage the lock out plate from the trigger when the distal end of the indicator member is positioned at a desirable location within the puncture.
17. The device of claim 1, wherein the indicator member is a wire that includes a distal end that is configured to form a loop when extended out of the deployment tube.
18. The device of claim 1, further comprising a pusher received by the deployment member, wherein the pusher supports the sealing element at a particular location within the deployment member.
19. The device of claim 1, further comprising an inlet port coupled toward the distal end of the deployment member, configured to take in blood when exposed to a vessel, and an outlet port communicatively coupled to the inlet port configured to allow the blood that entered the inlet port to exit.
20. The device of claim 1, wherein the sealing element is expandable.

21. The device of claim 1, wherein the sealing element is comprised of bioabsorbable material.
22. The device of claim 1, further comprising a wire actuator coupled to a distal section of the housing and engaged to the indicator wire such that when the wire actuator is pushed toward the housing, the indicator wire is pushed in the distal direction.
23. The device of claim 1, wherein the device is configured to be engaged with an introducer sheath.
24. A method for sealing a puncture, having an edge, in the wall of a lumen of a body comprising:
  - deploying a deployment member of a sealing device through the puncture, wherein the sealing device includes a sealing element and an indicator wire having a distal tip;
  - extending the indicator wire out of the deployment member when the sealing device is deployed through the puncture;
  - adjusting the position of the sealing device until the indicator wire is adjacent to the edge of the puncture;
  - retracting the indicator wire into the device;
  - retracting the deployment member relative to the sealing element; and
  - retracting the device from the puncture, wherein the indicator wire is retracted into the device and the deployment member is retracted relative to the sealing element.
25. The method of claim 24, wherein the indicator wire is retracted at a faster rate than the rate of retraction of the deployment member.
26. The method of claim 24, wherein the distal tip of the indicator wire forms a loop when deployed out of the sealing device.
27. The method of claim 24, wherein the indicator wire is retracted by the use of a first actuator and the deployment member is retracted by the use of a second actuator, wherein the first actuator is configured to withdraw the indicator wire within the deployment member before the sealing element is deployed.
28. The method of claim 27, wherein the first and second actuators are first and second gears, further wherein the first and second gears form first and second rack and pinion mechanisms respectively.

29. The method of claim 27, wherein the diameter of the second gear is substantially smaller than the diameter of the first gear.
30. The method of claim 27, wherein the first and second actuators are hydraulic devices.
31. The method of claim 24, further comprising the step of notifying an operator when the distal end of the indicator wire is positioned at the edge of the puncture.
32. The method of claim 31, wherein notifying the operator includes emitting an LED light.
33. The method of claim 31, wherein notifying the operator includes invoking an audio alarm.

## INTERNATIONAL SEARCH REPORT

International application No  
PCT/US2006/015681

**A. CLASSIFICATION OF SUBJECT MATTER**  
INV. A61B17/00

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)  
A61B A61M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2005/085856 A1 (GINN RICHARD S) 21 April 2005 (2005-04-21) cited in the application paragraph [0014] - paragraph [0023] paragraph [0039] - paragraph [0057] figures	1,2,9, 14,15, 17-23
X	WO 95/05206 A2 (BOSTON SCIENT CORP [US]; SHAW WILLIAM J [US]; CHU MICHAEL S H [US]; LE) 23 February 1995 (1995-02-23) page 25, line 14 - page 34, line 26 page 36, line 5 - line 9 figures 3-7	1-3,14, 15, 19-21,23

Further documents are listed in the continuation of Box C.

See patent family annex.

\* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but which is essential to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"G" document member of the same patent family

**INTERNATIONAL SEARCH REPORT**International application No.  
PCT/US2006/015681**Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: 24–33, because they relate to subject matter not required to be searched by this Authority, namely:  
Rule 39.1(iv) PCT – Method for treatment of the human or animal body by surgery
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest** The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-3, 9-13, 14-23

A device for sealing a puncture in the wall of the body lumen comprising an elongate deployment member with a sealing element releasably disposed inside, the deployment member coupled to a first actuator, and an elongated indicator member coupled to a second actuator, the first and second actuators encased within a housing.

---

2. claims: 4-8

A device for sealing a puncture in the wall of the body lumen comprising an elongate deployment member with a sealing element releasably disposed inside, the deployment member coupled to a first actuator, and an elongated indicator member coupled to a second actuator, the first and second actuators being gears.

---
